

Current status
point-of-view of user:

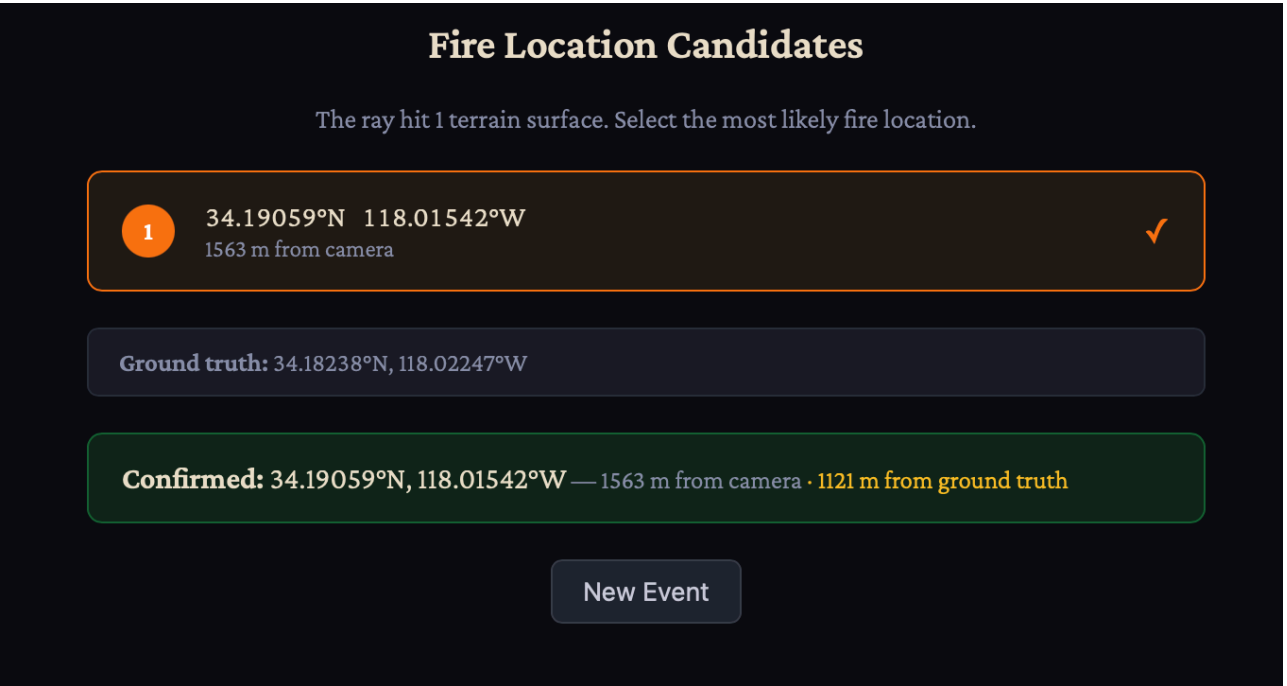

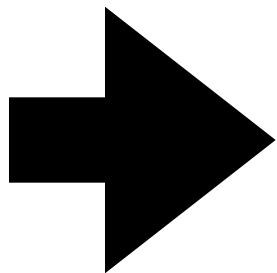

smoke is
detected

Human-in-the-loop aligns terrain projection

fire location
estimation
(described
in previous
milestones)

Human-in-the-loop chooses
best candidate among the
possible fire locations

Questions:

- How can we determine whether our estimates for the fire location are accurate enough, or how far away is still acceptable?
- Do we get more data (detected smoke with ground truth fire location and camera specifications)?
- Can we get some feedback on the current status? What should we focus on for the final submission?
